

Gas-turbine procurement checklist

A buyer checklist for reviewing a proposed generator package before committing to equipment. Use it to structure supplier diligence and the commercial review.

Define the requirement

- Project location, required MW, target energization date and load profile.
- Fuel specification and availability; frequency, voltage and site conditions.
- Permitting, emissions, interconnection and redundancy requirements.

Verify equipment and seller

- Manufacturer, model, serial number, year, hours and starts.
- Ownership or seller authorization, maintenance and preservation records.
- Inspection access, testing evidence and site-rated performance assumptions.

Confirm the complete scope

- Generator package, controls, switchgear and balance-of-plant inclusions.
- Transport, installation, commissioning and acceptance responsibilities.
- Warranty provider, covered items, exclusions and service-support pathway.

Document commercial terms

- Dated availability, reservation conditions and delivery basis.
- Price, payment milestones, delivery assumptions and acceptance conditions.
- Submit the project brief; confidential records can follow an appropriate NDA.

This checklist is not an equipment offer or confirmation of inventory. Availability, performance, pricing and delivery require project-specific verification and written terms.
